

CANON REPAIR GUIDE

FD LENSES

P R E F A C E

This Repair Guide is issued to insure the continued high quality of the CANON FD Lenses through correct repair procedures.

This Guide consists of four sections: Introduction, Disassembly, Replacement and Adjustment and the Appendix.

If any repairs are required, refer to this Guide. Any comments or suggestions concerning this Guide will be appreciated.

CONTENTS

Introduction

1.	Disassembly	
1.1	Lens Barrel	3
1.2	Lens system and Aperture Unit	4
1.3	Lens Mount	5
1.4	Helicoid	7
2.	Replacement and Adjustment	9
2.1	Aperture diameter	9
2.2	Replacement of Aperture Unit	9
2.3	Adjustment of Automatic Diaphragm Lever	9
2.4	Adjustment of Signal Lever	10
2.5	Replacement of Rear Cover	11
2.6	Adjustment of EE Pin	12
2.7	Assembly of Mount	13
2.8	Focus adjustment	13
2.9	Positioning of Front Lens Unit	13
3.	Appendix	
3.1	Measurement of S separation with height gage	15
3.2	Table of aperture diameters	17

Introduction

1. Since more functions have been added to FD Lens than FL Lens (an open aperture metering system and EE photography) the repair and checking procedures have increased accordingly. When repairing FD lenses, extreme care must be exercised to maintain the original precision.

1.1 Aperture diameter

Because this FD lens employs an open aperture metering system, errors in the aperture diameter result in exposure errors. It is, therefore, necessary to control the aperture diameter accuracy much more strictly than previously.

1.2 Aperture signal lever

The accuracy of this lever also has direct effect on that of the exposure meter. A special tool (FD Lever gauge-3) is required to check its position. (As the meter accuracy of the camera is to be measured after the lens is installed, when adjusting the meter the position of the aperture signal lever should be checked.)

1.3 Maximum aperture correction pin

This pin is mounted on the rear cover. Therefore, when replacing the rear cover, the head of the signal pin should be cut to the specified height. (See Para. 2.5)

2. All FD lenses have basically the same construction, and in this repair guide, explanation will be made using the FD 50mm 1:1.4 as the example.
3. A hand fitted lens spacing system is employed for the following lenses, so the lens system must be replaced as a unit:

FD 17mm 1:4	FD 24mm 1:2.8	FD 28mm 1:3.5
FD 35mm 1:2	FD 35mm 1:3.5	

4. For the following lenses, positioning the front lens unit should be carried out because they have the "Full Range Aberration-Free System". This system consists of a second helicoid in the front lens group.

FD 17mm 1:4	FD 24mm 1:28	FD 35mm 1:2
-------------	--------------	-------------

Note: Hand fitted system:

The individual lens elements are hand fitted and spaced at the factory. The tools and test equipment necessary are extremely costly so these lens systems are supplied as a unit only.

1. Disassembly

1.1 Lens Barrel

- | | | |
|------------------|---|---|
| 1. Front Ring | 1. $\frac{\text{Name Ring}}{27-7122}$ | 2. $\frac{\text{Screw}}{X40-170307} \times 3$ |
| 2. Focusing Ring | 3. $\frac{\text{Front Ring}}{29-9569}$ | 5. $\frac{\text{Focusing Ring}}{29-9663}$ |
| 3. Lens Barrel | 4. $\frac{\text{Screw}}{X40-140257} \times 3$ | 7. Lens Barrel |
| | 6. $\frac{\text{Screw}}{X91-172490} \times 3$ | |
